

FULL STACK ENGINEER

Dimitrije Bukejlovic

dimibukejlovic@icloud.com | [GitHub](#) | [LinkedIn](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Analytical Full Stack Engineer dedicated to designing scalable distributed systems, ensuring high performance, and maintaining architectural integrity across modern frontend and backend environments. Proactive leader in implementing secure architectures, role-based access control (RBAC), and low-latency data-flow models. Expert in translating complex institutional and technical requirements into production-ready software solutions with structured data persistence layers.

PROFESSIONAL EXPERIENCE

TokenFlow | Full Stack Engineer Jan 2025 - Present

- Designed and implemented a scalable multi-tier architecture using Node.js/Express and PostgreSQL, introducing connection pooling and optimized indexing to support concurrent data streams and 10M+ database rows with sub-second query execution.
- Engineered robust API architectures, RBAC, and secure token-based authentication workflows, reducing unauthorized access attempts and enhancing data-flow reliability.
- Established high-quality coding standards and automated linting/testing pipelines using Jest and Cypress, ensuring 100% release readiness and predictable code delivery for high-performance platform features.

ScaleRoad LLC | Full Stack Engineer Dec 2023 - Jan 2025

- Optimized complex client-facing workflows and responsive component architecture, leveraging advanced state-management patterns and lazy-loading to improve page load speed by 40%.
- Formulated seamless frontend-backend API contracts and implemented aggressive data-caching strategies, reducing API latency by 30% across core system components.
- Standardized global error-handling patterns and defensive loading states across desktop and mobile environments, eliminating UI layout shifts and unhandled runtime exceptions.

Vertex Digital Studio | Full Stack Engineer (Contract / Remote) Jan 2023 - Dec 2023

- Architected end-to-end full-stack solutions utilizing Node.js and Laravel for 5+ US-based startups and e-commerce clients, translating high-level business requirements into production-ready dashboards, secure auth flows, and 20+ core RESTful API endpoints.
- Designed scalable database schemas and relational persistence layers across varied client ecosystems, optimizing query execution paths to handle 500K+ daily data rows with 100% strict data integrity.
- Established repeatable engineering standards by implementing senior Git workflows, delivering a library of 30+ reusable UI components, and reducing deployment failures by 25% through automated testing and documentation.

SKILLS

Languages: TypeScript, JavaScript, SQL, PostgreSQL, Bash Shell Scripting

Backend & Systems: Node.js, Express, Laravel, RESTful APIs, GraphQL, Redis, WebSockets, BullMQ, Prisma, Eloquent

Frontend Engineering: React, Next.js, Redux Toolkit, Tailwind CSS, Radix UI, Server-Side Rendering (SSR), Core Web Vitals

Cloud & DevOps: Docker, Docker Compose, AWS, GitHub Actions, CI/CD Pipelines, Vercel, Turborepo (Monorepos), Linux Administration

Security & Testing: Authentication (OAuth2, JWT), Granular RBAC, Jest, Vitest, Cypress, TDD

SELECTED PROJECT CASE STUDIES

Nexus Console: Infrastructure Dashboard | Node.js, Express, Next.js, PostgreSQL, Supabase, Tailwind CSS

- Architected a high-fidelity monitoring console featuring secure multi-tenant data isolation, hierarchical workspace logic, and granular role-based access control (RBAC).
- Structured optimized database schemas and relational data models to completely eliminate cross-tenant data leakage risks across concurrent organization environments.
- Implemented heavy server-side caching and data streaming pipelines, delivering sub-second rendering overhead for complex, data-heavy infrastructure layouts.

SYNAPSE Developer Platform | React, Next.js, Redux Toolkit, Tailwind CSS, Radix UI

- Developed a highly responsive developer platform leveraging reusable UI primitives and stable data flows to guarantee a fluid visual experience across all device form factors.
- Optimized global state propagation patterns and component lifecycle render passes to minimize client-side main thread blockages during rapid user interactions.
- Managed data hydration for heavy system activity feeds and session streams, ensuring zero frame drops under continuous production-level data updates.

DevPitch Pro: Developer Pitch Workspace | TypeScript, Next.js, Node.js, AI Workflows, Radix UI

- Engineered an AI-assisted workspace architecture that dynamically transforms raw technical data inputs into highly structured professional narratives and recruiter-facing formats.
- Built repeatable LLM integration pipelines with structured JSON outputs to guarantee consistent output styling and deterministic content quality.
- Implemented isolated content state stores and recruiter-facing export paths, enabling structured data mapping without relying on heavy external runtime dependencies.
